ACADEMIC YEAR: 2025 – 2026

REGULATIONS – 2023

MARCH 2026

RAJALAKSHMI ENGINEERING COLLEGE

(An Autonomous Institution Affiliated to Anna University, Chennai)

Bonafide Certificate

This is to certify that **Ms. Divya Lakshmi D (Register Number: 2116241801060),** Department of Artificial Intelligence and Machine Learning, Rajalakshmi Engineering College, has successfully completed the internship titled **"Data Science"** at **Labmentix** for a duration of **45 days** from **15.12.2026** to **01.02.2026** during the academic year **2025–2026**, as a part of the academic curriculum requirement.

This internship record is submitted in partial fulfillment of the requirements for the award of the degree of Bachelor of Technology in Artificial Intelligence and Machine Learning.

Dr. J M GNANASEKAR
HEAD OF THE DEPARTMENT

Mrs. RENUKADEVI S
ACADEMIC HEAD

Submitted to internship viva - voce examination held on ……

INTERNAL EXAMINER 1

INTERNAL EXAMINER 2

DECLARATION

I hereby declare that the internship report titled **"Data Science Internship"** at **"Labmentix"** submitted by me is a genuine record of the work carried out by me during the internship period at **Labmentix**.

I affirm that the work presented in this report is original and has been completed as part of the academic requirements of Rajalakshmi Engineering College for the academic year **2025-2026**. All the information and findings included in this report are true to the best of my knowledge.

The internship work was carried out under the guidance of my faculty mentor and industry supervisors, and this report reflects my learning and practical experience gained during the internship.

Signature:

Name: Divya Lakshmi D

Register Number: 211624180106O

Date:

ACKNOWLEDGEMENT

I would like to express my sincere gratitude to the management of Rajalakshmi Engineering College for providing me with the opportunity to undergo this internship as part of the academic curriculum.

I extend my heartfelt thanks to our Chairman, **Mr. S. Meganathan**, and Chairperson, **Dr. (Mrs.) Thangam Meganathan**, for providing excellent infrastructure and a supportive academic environment that encourages practical learning and industry exposure.

I am deeply thankful to our Principal, **Dr. S. N. Murugesan**, for his constant encouragement and motivation to explore real-world applications of technology. I would also like to thank our Head of the Department, **Dr. J. M. Gnanasekar**, for his valuable guidance and support throughout the internship period.

We express our sincere gratitude to our Academic Head, **Mrs. S. Renukadevi**, for her valuable guidance and continuous support throughout the internship. We also extend our heartfelt thanks to our mentor, **Ms. Ponnila P,** for her encouragement, technical guidance, and support during the successful completion of this internship.

I would also like to extend my gratitude to the team at **Labmentix** for providing me with the opportunity to work on Data Science projects. Their mentorship, technical guidance, and professional support during the 15-week internship helped me gain practical exposure to industry-standard tools, technologies, and workflows.

Finally, I thank all those who directly or indirectly supported me in completing this internship and report successfully.

Rajalakshmi Engineering College
Thandalam, Chennai.

1. ABSTRACT

The rapid growth of data across industries has made data analysis and machine learning essential for deriving meaningful insights and supporting decision-making. During the internship, multiple data science projects were developed focusing on exploratory data analysis, data preprocessing, and customer analytics using real-world datasets. The first project involved analyzing an Amazon Prime Movies and TV Shows dataset to understand content distribution, genre trends, and audience engagement patterns. Various visualization techniques were applied to identify key insights such as the dominance of movies, higher ratings for TV shows, and the relationship between popularity and user ratings.

The second project focused on analyzing the Mental Health in Tech Survey dataset to study workplace mental health conditions, employee attitudes, and organizational support systems. Data cleaning techniques such as handling missing values, standardizing categorical variables, and removing inconsistencies were applied. The analysis revealed important insights regarding mental health awareness, treatment-seeking behavior, and the impact of company policies on employee well-being.

The third project involved an advanced analysis of e-commerce transaction data to understand customer purchasing behavior. Data preprocessing steps including removal of invalid entries, handling missing values, and feature engineering were performed. RFM (Recency, Frequency, Monetary) analysis was applied to segment customers, followed by K-Means clustering to group customers into categories such as high-value, regular, occasional, and at-risk. The results were visualized using multiple charts and presented through a business-oriented approach to derive actionable insights.

Overall, these projects demonstrate the practical application of data science techniques including data cleaning, exploratory data analysis, visualization, and machine learning. The outcomes highlight how data-driven approaches can be used to understand user behavior, improve business strategies, and support informed decision-making across different domains.

2. INTRODUCTION

2.1 About the Company

LabMentix is a technology-focused organization that provides training and internship opportunities in domains such as Data Science, Machine Learning, and Artificial Intelligence. The company emphasizes hands-on learning through real-world datasets, structured assignments, and project-based training. It aims to bridge the gap between academic knowledge and industry requirements by enabling students to work on practical data-driven problems. During the internship, continuous guidance and well-defined tasks were provided to understand data analysis workflows and basic machine learning concepts.

2.2 Purpose of the Internship

The purpose of the internship was to gain practical exposure to data analysis and data science techniques using real-world datasets. The internship focused mainly on understanding data preprocessing, exploratory data analysis (EDA), data visualization, and deriving meaningful insights. Additionally, it provided basic exposure to machine learning concepts such as clustering and customer segmentation. The internship helped in improving analytical thinking, data handling skills, and the ability to interpret data for business decision-making.

3. OBJECTIVES OF THE INTERNSHIP

• To develop a strong understanding of data science concepts, particularly Exploratory Data Analysis (EDA), and their practical application in analyzing real-world datasets such as streaming platforms, workplace surveys, and e-commerce data.

• To learn and implement data preprocessing techniques including data cleaning, handling missing values, removing inconsistencies, and transforming variables to improve data quality and reliability for analysis.

• To perform structured data analysis using univariate, bivariate, and multivariate techniques, and visualize insights using Python libraries such as Pandas, Matplotlib, and Seaborn for better interpretation of patterns and trends.

• To gain practical exposure to basic machine learning techniques, especially clustering methods like K-Means, and apply RFM (Recency, Frequency, Monetary) analysis for customer segmentation in e-commerce data.

• To analyze and interpret data-driven insights to support business decision-making, including content strategy, employee well-being improvements, and customer retention strategies.

• To enhance technical skills, analytical thinking, and problem-solving abilities through hands-on project development and real-world data analysis tasks.

4. DESCRIPTION OF THE PROJECTS

• Project 1: Amazon Prime Movies and TV Shows Analysis

This project focuses on performing Exploratory Data Analysis (EDA) on Amazon Prime content data to understand distribution, trends, and audience preferences. It analyzes factors such as content type, genres, release trends, and IMDb ratings to derive insights that support content strategy and user engagement.

• Project 2: Mental Health in Tech Survey Analysis

This project involves analyzing survey data to study mental health conditions, workplace environment, and employee attitudes in the tech industry. It identifies key factors influencing treatment-seeking behavior and highlights the importance of organizational support and policies in improving employee well-being.

• Project 3: E-Commerce Customer Segmentation using RFM and Clustering

This project analyzes online retail transaction data to understand customer purchasing behavior. It uses RFM (Recency, Frequency, Monetary) analysis and K-Means clustering to segment customers into different groups, helping businesses design targeted marketing and retention strategies.

4.1. Tasks Handled During the Internship

• Performed data collection and loading of real-world datasets from different domains such as streaming platforms, workplace surveys, and e-commerce transactions.

• Conducted data preprocessing including handling missing values, removing duplicates, correcting inconsistencies, and transforming variables to make the dataset analysis-ready.

• Carried out Exploratory Data Analysis (EDA) using structured approaches like univariate, bivariate, and multivariate analysis to understand data patterns and relationships.

• Created multiple data visualizations such as bar charts, histograms, scatter plots, box plots, and heatmaps to extract meaningful insights and support data storytelling.

• Implemented feature engineering techniques such as creating new variables (e.g., total price,

RFM metrics) to enhance analysis quality.

• Applied basic machine learning techniques, including K-Means clustering, to perform customer segmentation based on RFM (Recency, Frequency, Monetary) analysis.

• Interpreted analytical results and derived actionable insights for business decision-making such as content strategy, mental health policy improvements, and customer retention strategies.

• Documented the entire workflow, including problem understanding, data processing steps, visualization insights, and final conclusions in a structured format.

4.2. METHODS USED

• Data Collection and Loading: Imported datasets using Python libraries such as Pandas for structured data handling.

• Data Preprocessing: Applied techniques like handling missing values (dropna, fillna), removing duplicates, data type conversion, and standardization of categorical variables.

• Exploratory Data Analysis (EDA): Used statistical summaries and visualization techniques to explore data distribution, relationships, and trends.

• Data Visualization: Utilized libraries such as Matplotlib and Seaborn to create charts like histograms, bar plots, scatter plots, box plots, and heatmaps.

• Feature Engineering: Created new meaningful features such as Total Price and RFM metrics (Recency, Frequency, Monetary) for deeper analysis.

• Statistical Analysis: Performed hypothesis testing and correlation analysis (e.g., t-test, Pearson correlation) to validate assumptions and relationships.

• Machine Learning Technique: Implemented K-Means clustering for customer segmentation and used the Elbow Method to determine the optimal number of clusters.

• Data Interpretation: Analyzed results and translated findings into business insights and recommendations for decision-making.

4.3. TOOLS USED

• Python: Primary programming language used for data analysis, preprocessing, and implementation of machine learning techniques.

• Pandas: Used for data manipulation, cleaning, and handling structured datasets efficiently.

• NumPy: Applied for numerical computations and handling arrays during data processing.

• Matplotlib: Used for creating basic visualizations such as line charts, bar graphs, and histograms.

• Seaborn: Used for advanced and attractive statistical visualizations such as heatmaps, box plots, and correlation plots.
• Scikit-learn: Utilized for implementing machine learning algorithms such as K-Means clustering and performing statistical analysis.
• Google Colab: Used as the development environment for writing, executing, and documenting code.
• Microsoft PowerPoint: Used for presenting the project insights and business interpretations in a structured and visual format.

4.4. RESULTS

• The Amazon Prime EDA project revealed that movies dominate the platform, while TV shows tend to have slightly higher ratings, and genres like Drama and Comedy are the most popular among users.
• The Mental Health in Tech analysis identified key issues such as workplace stigma, lack of open discussion, and the positive impact of organizational support systems on employee well-being and treatment-seeking behavior.
• The E-commerce project showed that a small group of customers contributes a major portion of revenue, while many customers have low engagement or are at risk of churn.
• RFM analysis and K-Means clustering successfully segmented customers into High-Value, Regular, Occasional, and At-Risk groups, enabling targeted marketing strategies.
• Data visualization and analysis techniques helped in identifying meaningful patterns, trends, and relationships across all datasets.
• The projects demonstrated how data-driven insights can support business decisions such as content planning, employee welfare improvements, and customer retention strategies.

```
# Chart - 1 visualization code
#counts how many movies and TV shows are in the dataset
titles['type'].value_counts().plot(kind='bar', title='Movies vs TV Shows on Amazon Prime')
plt.xlabel('Content Type')
plt.ylabel('Count')
plt.show()
```

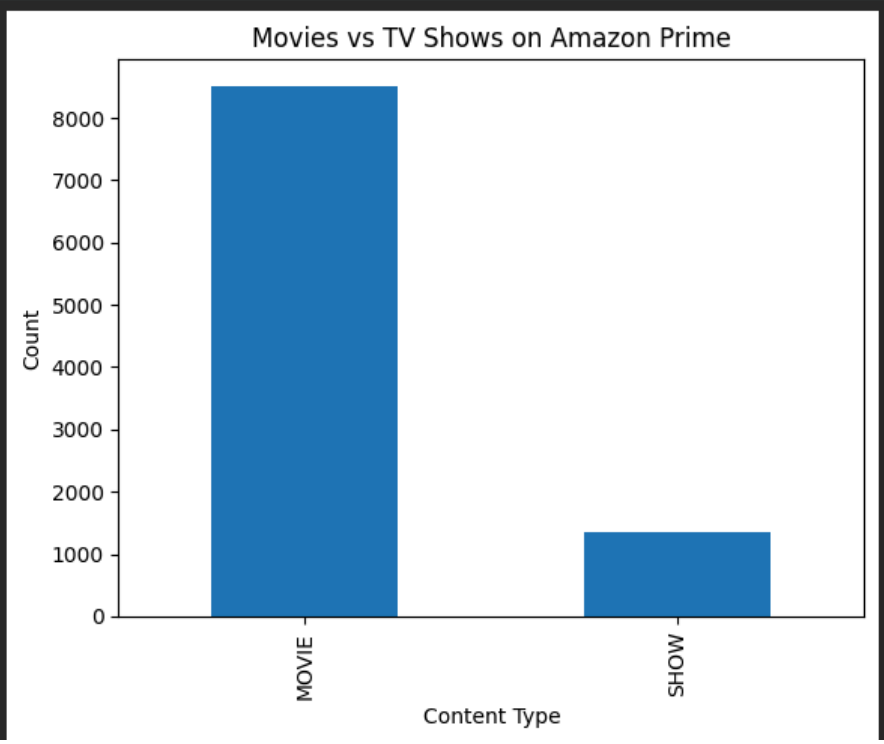

Figure 4.4.1 Movies vs TV Shows Bar Chart

This chart compares the number of movies and TV shows available on the platform. It shows that movies dominate the content library. This indicates a stronger focus on movie-based content.

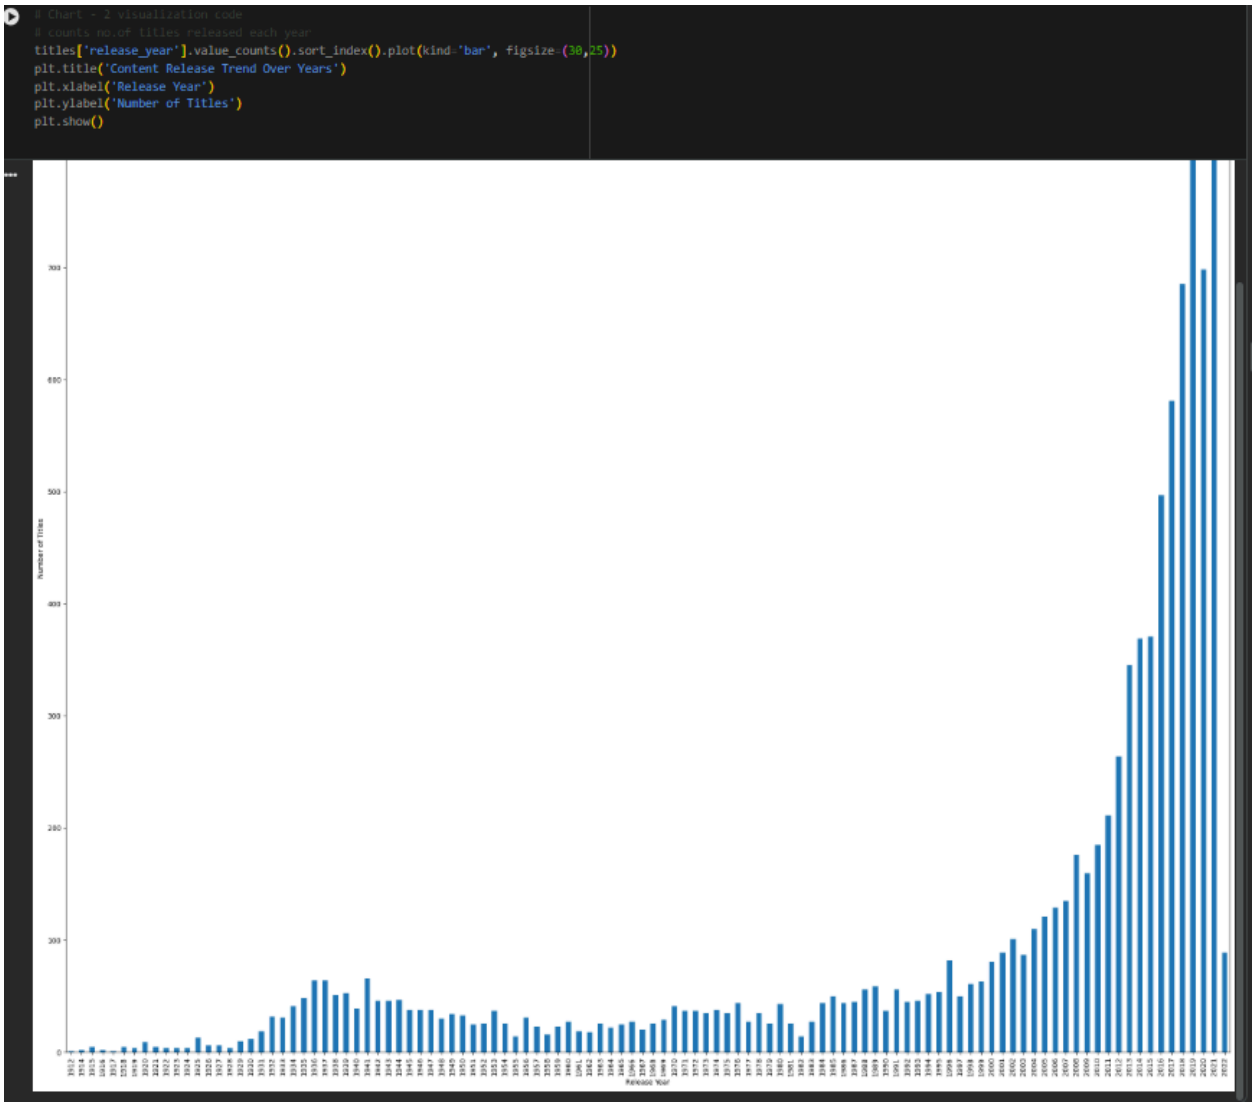

Figure 4.4.2 Content Release Trend(Year wise Chart)

This chart shows the number of titles released over the years. It highlights a significant increase in content production in recent years. This reflects the rapid growth of OTT platforms.

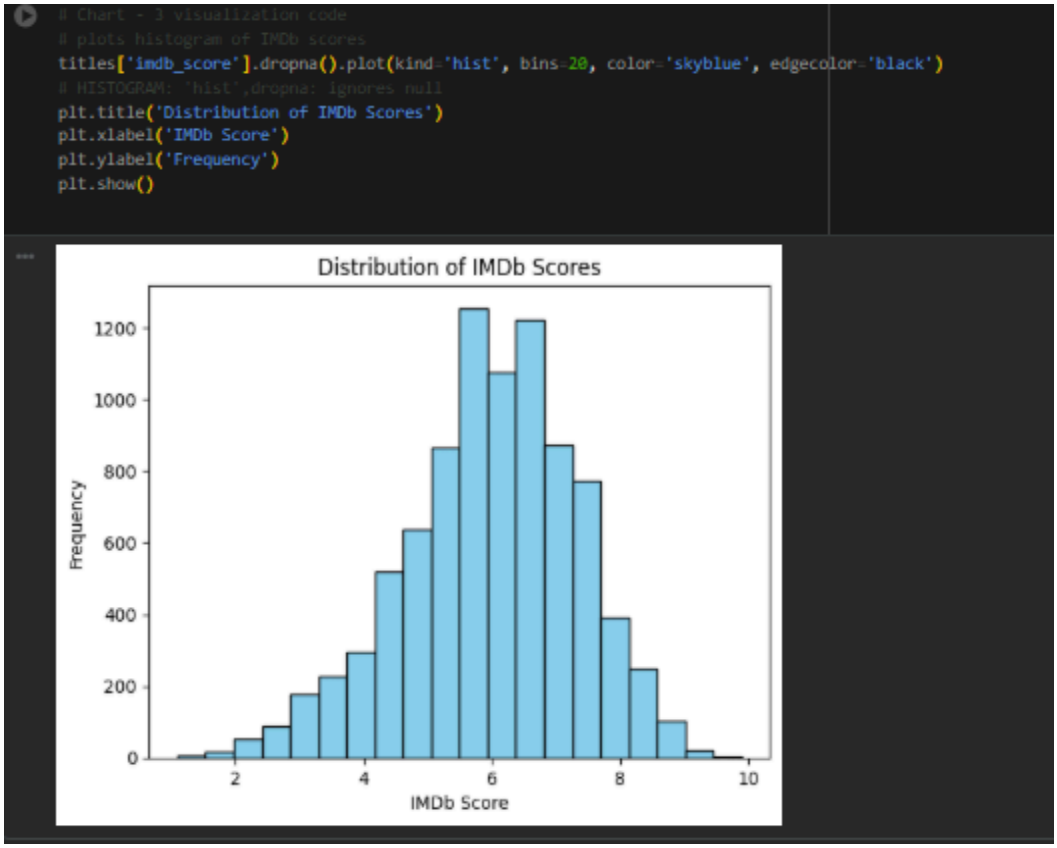

Figure 4.4.3 IMDb Score Distribution(Histogram)

This histogram shows how ratings are distributed across all content. Most titles have moderate ratings, with fewer extremely high or low scores. This indicates average content quality overall.

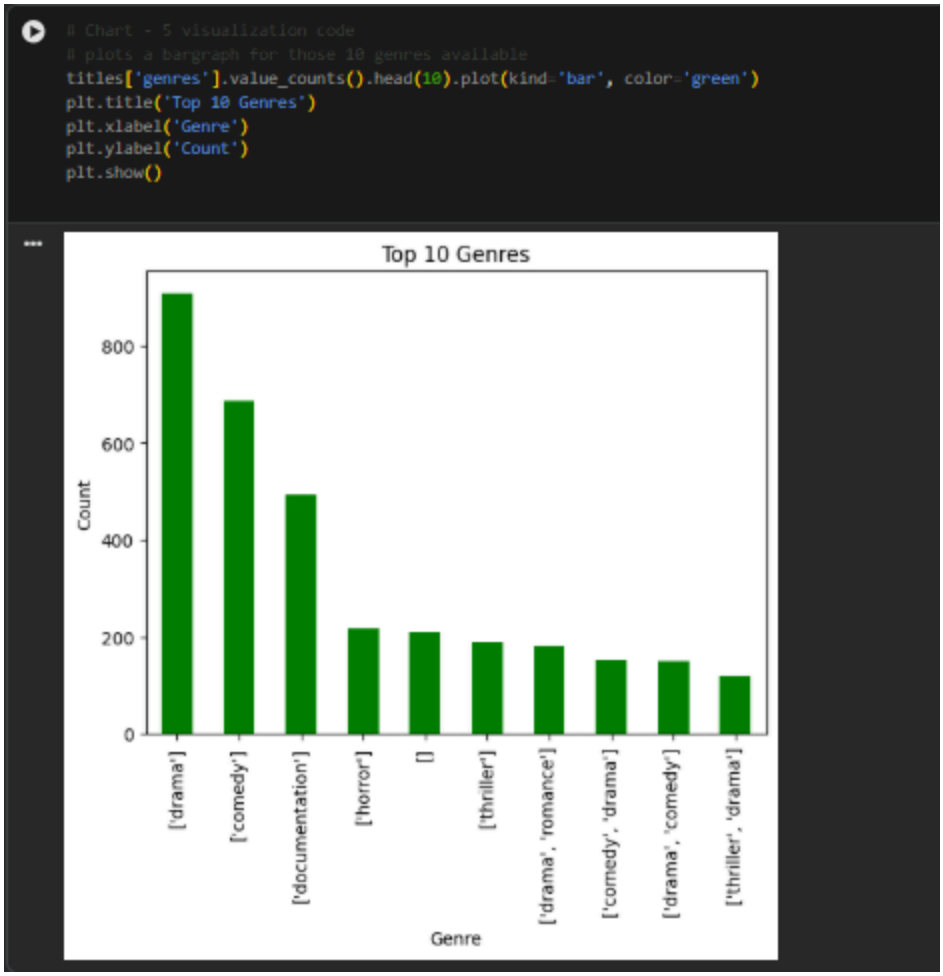

Figure 4.4.4 Top Genres Bar Chart

This chart displays the most common genres on the platform. Genres like Drama and Comedy appear most frequently. This reflects audience preferences and content strategy.

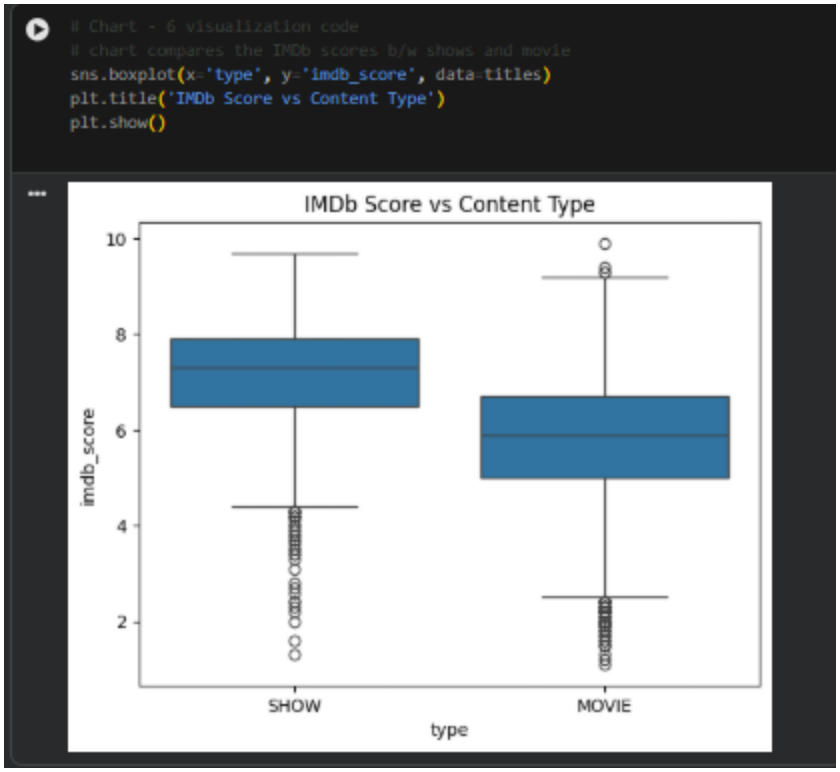

Figure 4.4.5 IMDb Score vs Content Type(Box Plot)

This boxplot compares ratings between movies and TV shows. It shows that TV shows tend to have slightly higher median ratings. This suggests better engagement with episodic content.

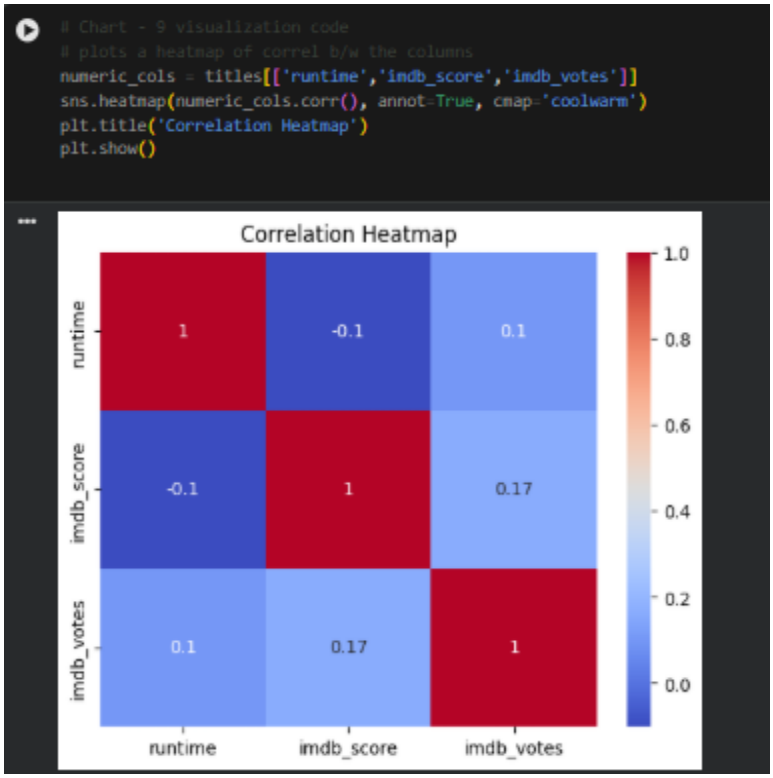

Figure 4.4.6 Correlation Heatmap

This heatmap shows relationships between numerical variables like runtime, votes, and ratings. A positive correlation exists between votes and ratings. This indicates popular content is generally well-rated.

```
# Chart - 1 visualization code

plt.figure(figsize=(8,5))
sns.histplot(df_clean['Age'], bins=20, kde=True)
plt.title("Age Distribution of Respondents")
plt.show()
```

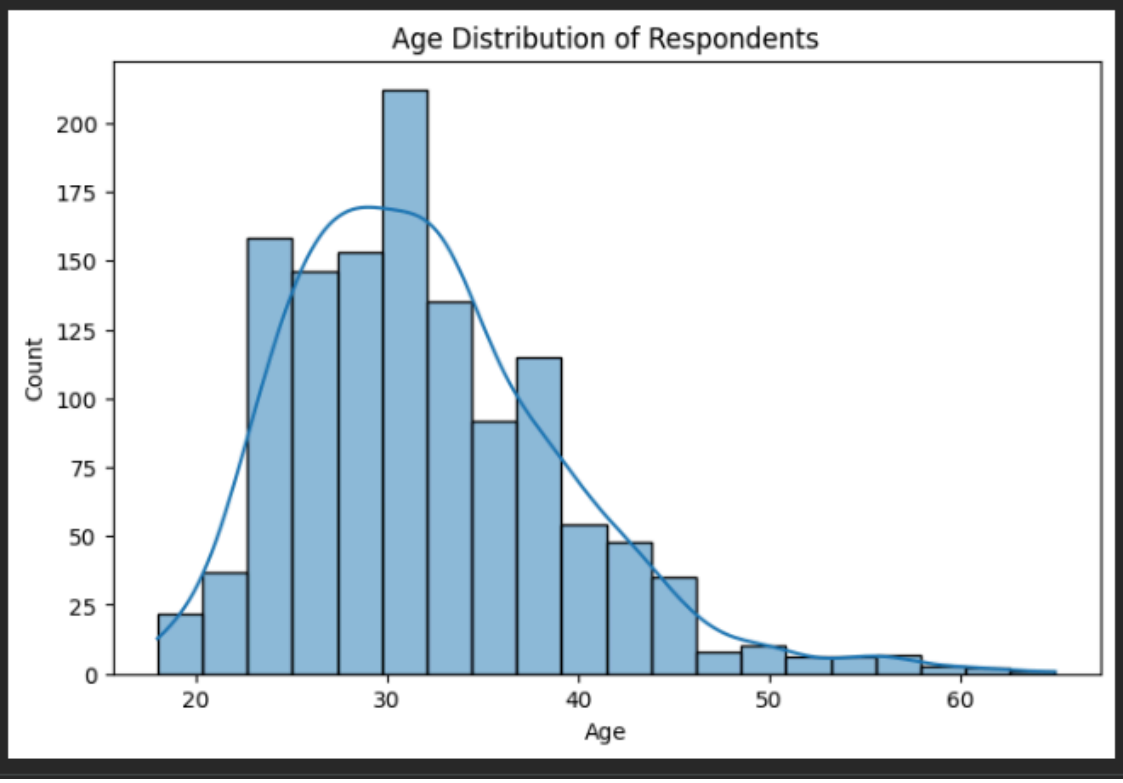

Figure 4.4.7 Age Distribution(Histogram)

This chart shows the distribution of respondents by age. Most participants fall between 20–40 years. This indicates a younger workforce in the tech industry.

Figure 4.4.8 Gender Distribution(Countplot)

This chart shows the number of respondents by gender. Male participants dominate the dataset. This highlights a gender imbalance in the survey.

```
# Chart - 3 visualization code

plt.figure(figsize=(6,4))
sns.countplot(x='treatment', data=df_clean)
plt.title("Mental Health Treatment Seeking")
plt.show()
```

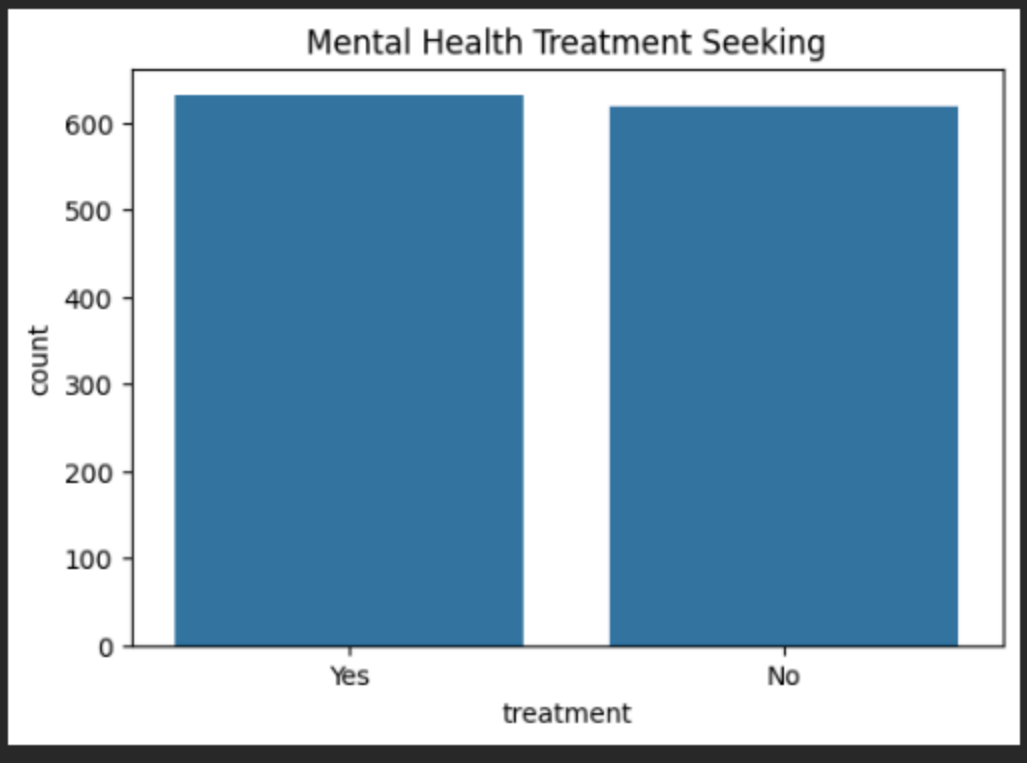

Figure 4.4.9 Mental Health Treatment Seeking(yes/no Bar Chart)

This chart shows how many respondents have sought mental health treatment. A significant portion has not sought help. This indicates possible stigma or lack of awareness.

```
# Chart - 4 visualization code

plt.figure(figsize=(6,4))
sns.countplot(x='family_history', hue='treatment', data=df_clean)
plt.title("Family History vs Treatment")
plt.show()
```

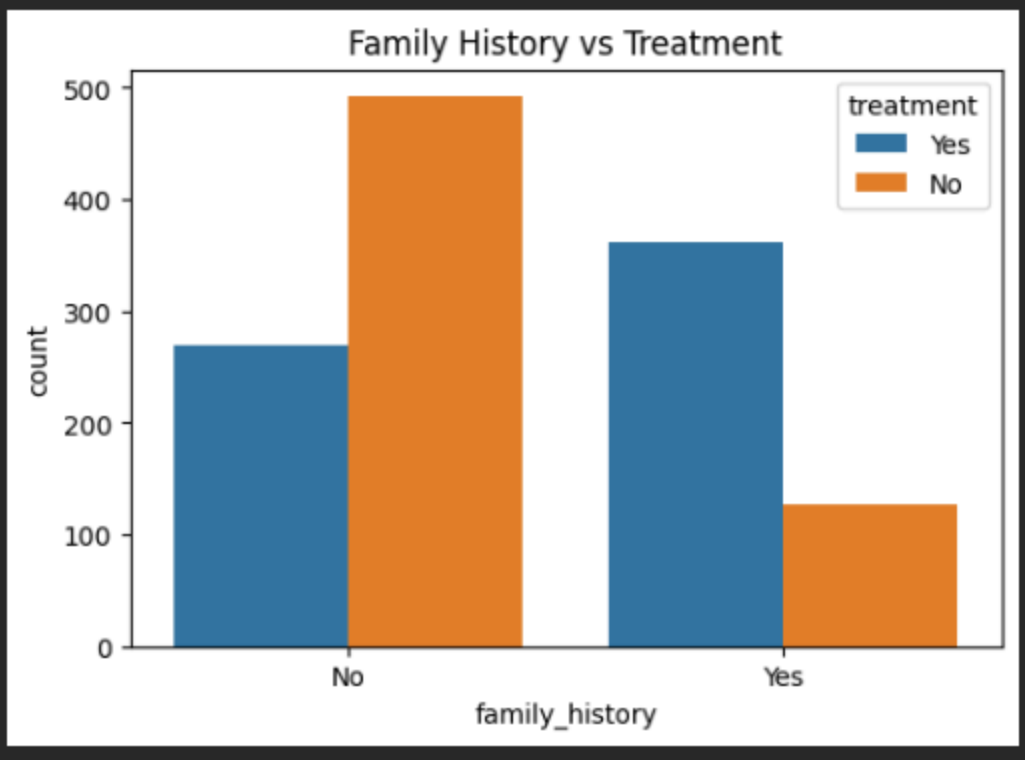

Figure 4.4.10 Family History vs Treatment (Countplot with hue)

This chart compares treatment behavior based on family history of mental illness. Individuals with family history are more likely to seek treatment. This shows awareness plays an important role.

```
# Chart - 5 visualization code

plt.figure(figsize=(7,4))
sns.countplot(x='work_interfere', data=df_clean)
plt.title("Mental Health Interference with Work")
plt.show()
```

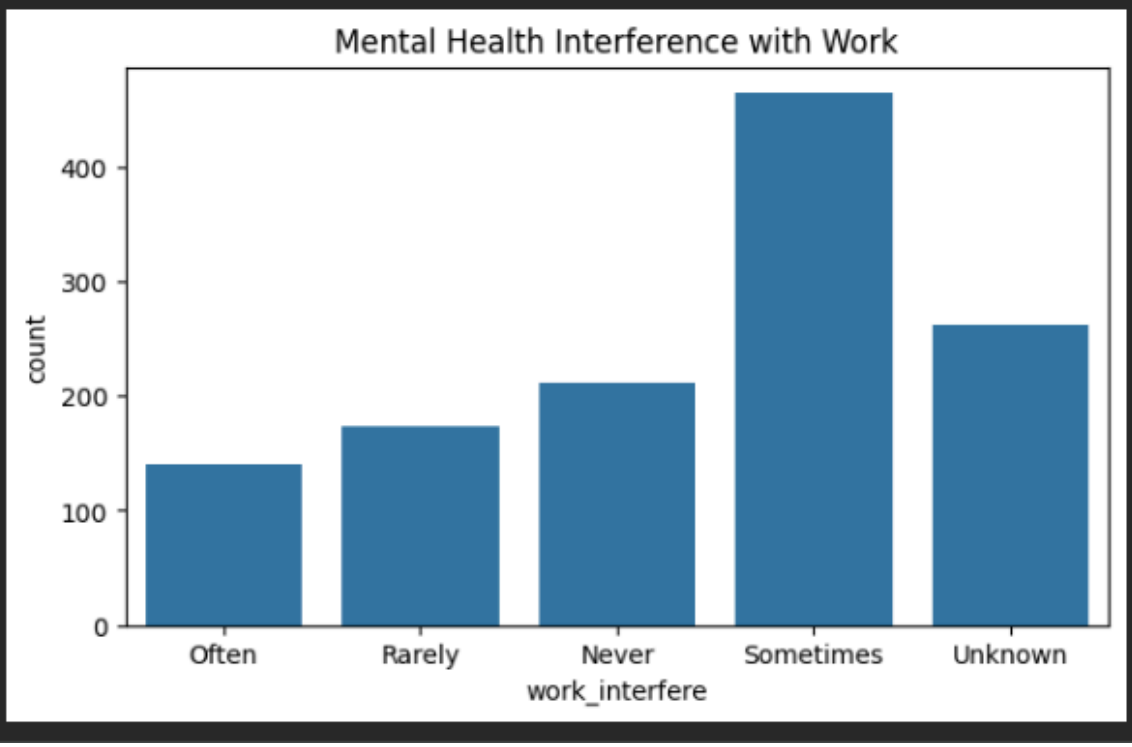

Figure 4.4.11 Mental Health Interference with Work(Bar Chart)

This chart shows how mental health affects work performance. Many respondents report interference in work. This indicates a direct impact on productivity.

```
# Chart - 6 visualization code

plt.figure(figsize=(8,4))
sns.countplot(x='no_employees', hue='benefits', data=df_clean)
plt.title("Company Size vs Mental Health Benefits")
plt.show()
```

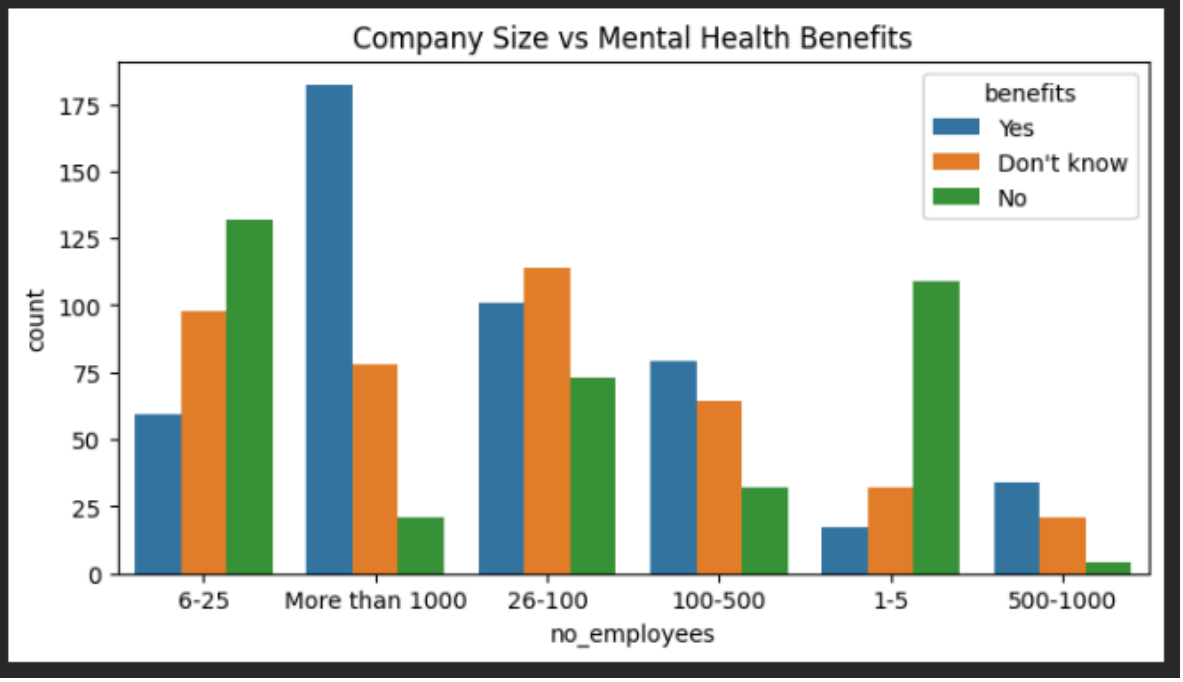

Figure 4.4.12 Benefits/Workplace Support (Bar Chart)

This chart shows availability of mental health benefits in companies. Not all organizations provide proper support. This highlights gaps in workplace policies.

```
#Top 10 Products

df['Description'].value_counts().head(10).plot(kind='bar')
plt.show()
```

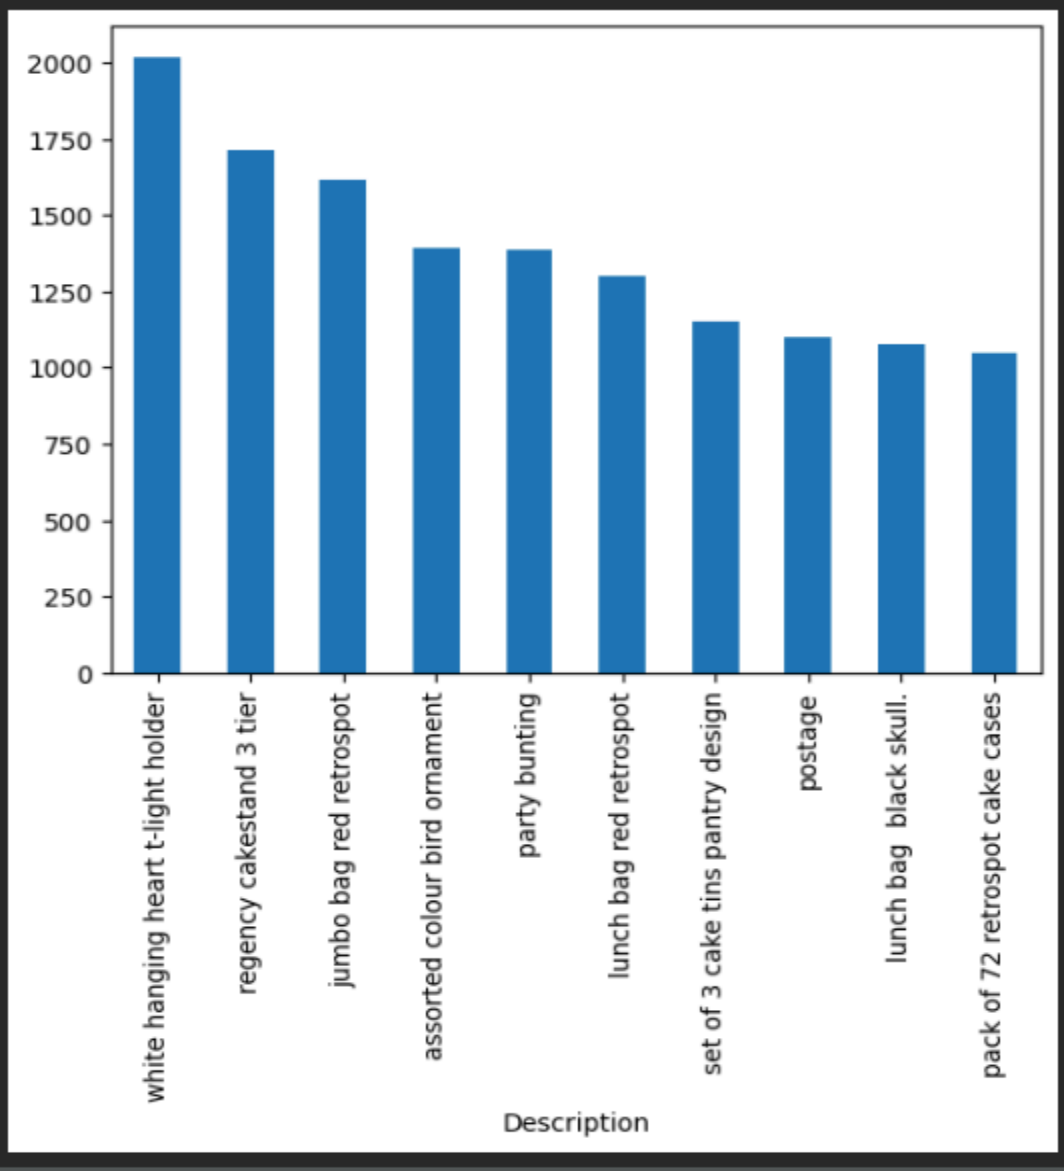

Figure 4.4.13 Top selling Products(Bar Chart)

This chart shows the most frequently purchased products. A small number of products dominate sales. This indicates strong customer preference for specific items.

```
#Orders over Time

df.set_index('InvoiceDate').resample('M').size().plot()
plt.show()
```

```
/tmp/ipykernel_4948/1334798793.py:3: FutureWarning: 'M' is deprecated and will be removed
  df.set_index('InvoiceDate').resample('M').size().plot()
```

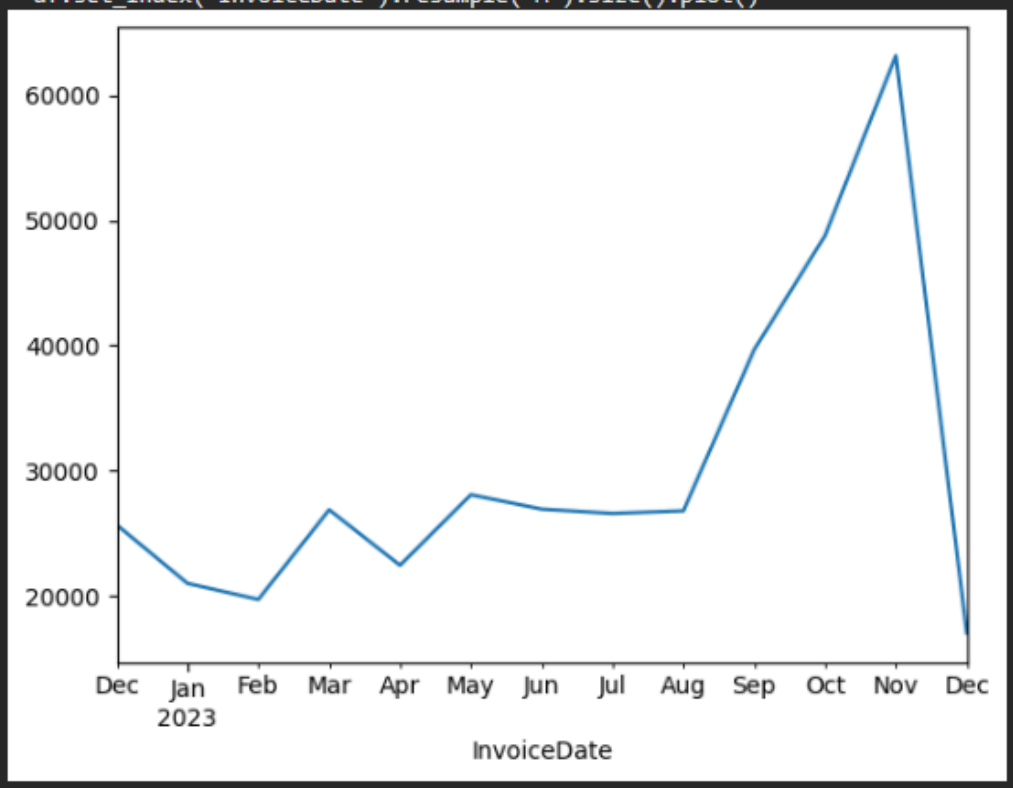

Figure 4.4.14 Transactions vs Orders Over Time(Line Chart)

This chart shows how transactions change over time. It reveals fluctuations and seasonal trends in purchases. This helps in planning inventory and promotions.

```
# Revenue by Country

df.groupby('Country')['TotalPrice'].sum().sort_values(ascending=False).head(10).plot(kind='bar')
plt.show()
```

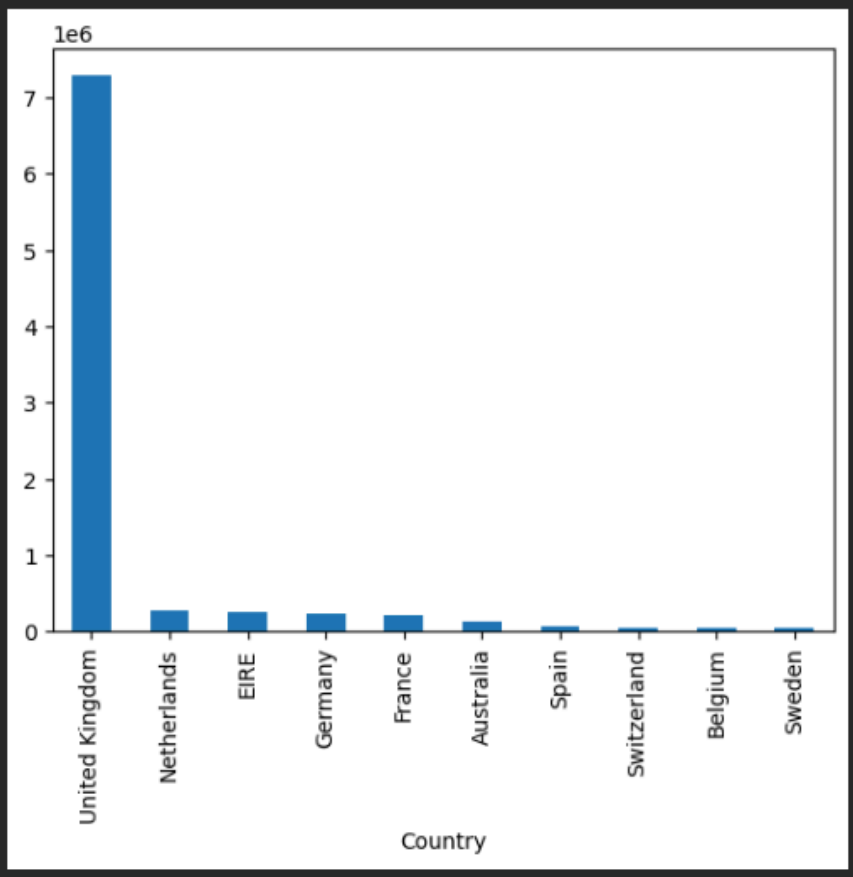

Figure 4.4.15 Revenue by Country(Bar Chart)

This chart shows which countries generate the highest revenue. A few countries contribute most of the revenue. This indicates key markets for the business.

```
# Customer Frequency

df.groupby('CustomerID')['InvoiceNo'].count().plot(kind='hist', bins=50)
plt.show()
```

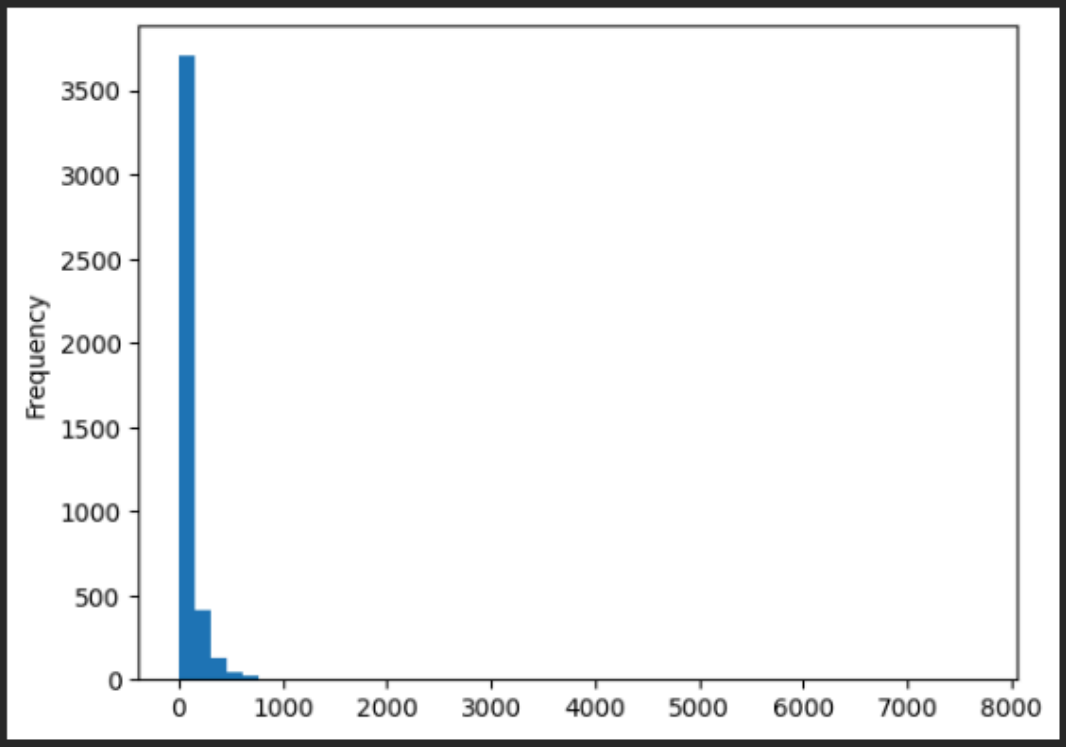

Figure 4.4.16 Customer Frequency Distribution(Histogram)

This chart shows how often customers make purchases. Most customers buy rarely, while few are frequent buyers. This highlights the importance of loyal customers.

```python
rfm = df.groupby('CustomerID').agg({
      'InvoiceDate': lambda x: (df['InvoiceDate'].max() - x.max()).days,
          'InvoiceNo': 'count',
              'TotalPrice': 'sum'
              })
rfm.columns = ['Recency','Frequency','Monetary']

sns.heatmap(rfm.corr(), annot=True, cmap='coolwarm')
plt.title('RFM Correlation Heatmap')
plt.show()
```

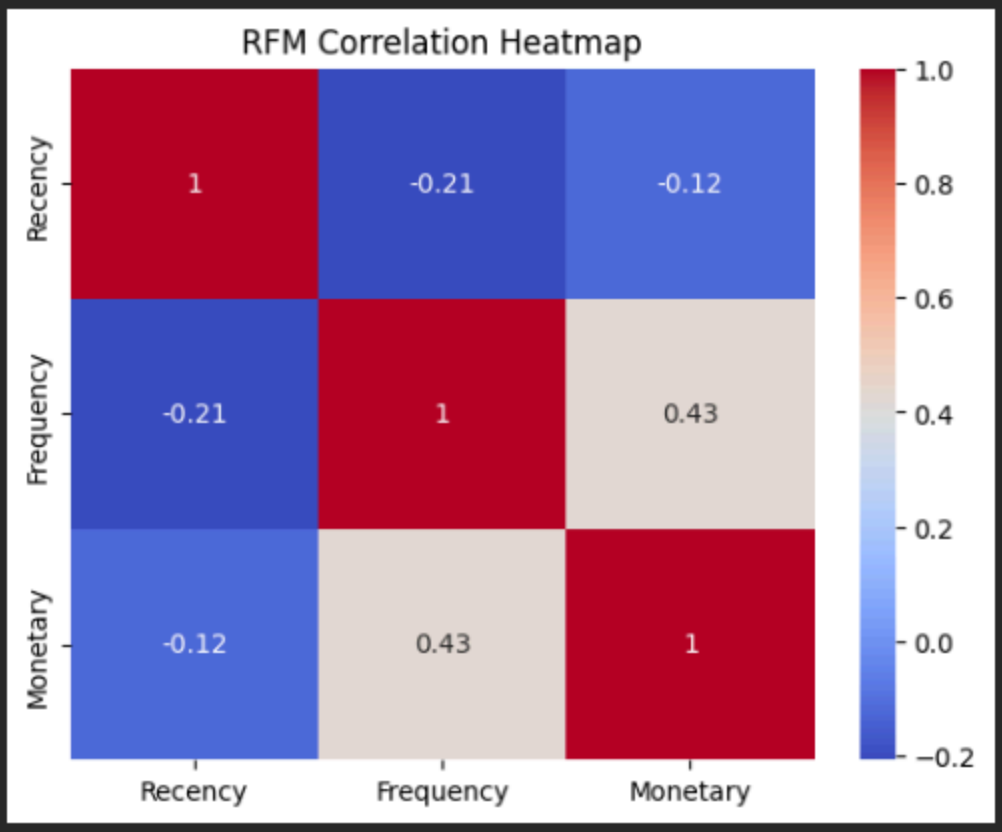

Figure 4.4.17 RFm Correlation Heatmap

This heatmap shows relationships between recency, frequency, and monetary values. Frequency and monetary are positively correlated. This indicates loyal customers spend more.

```python
# Customer Cluster Scatter Plot (RFM 3D)

from mpl_toolkits.mplot3d import Axes3D
kmeans = KMeans(n_clusters=4, random_state=42)
rfm['Cluster'] = kmeans.fit_predict(rfm_scaled)
fig = plt.figure(figsize=(10,8))
ax = fig.add_subplot(111, projection='3d')
ax.scatter(rfm['Recency'], rfm['Frequency'], rfm['Monetary'], c=rfm['Cluster'], cmap='Set1')
ax.set_xlabel('Recency')
ax.set_ylabel('Frequency')
ax.set_zlabel('Monetary')
plt.title('3D Customer Cluster Visualization')
plt.show()
```

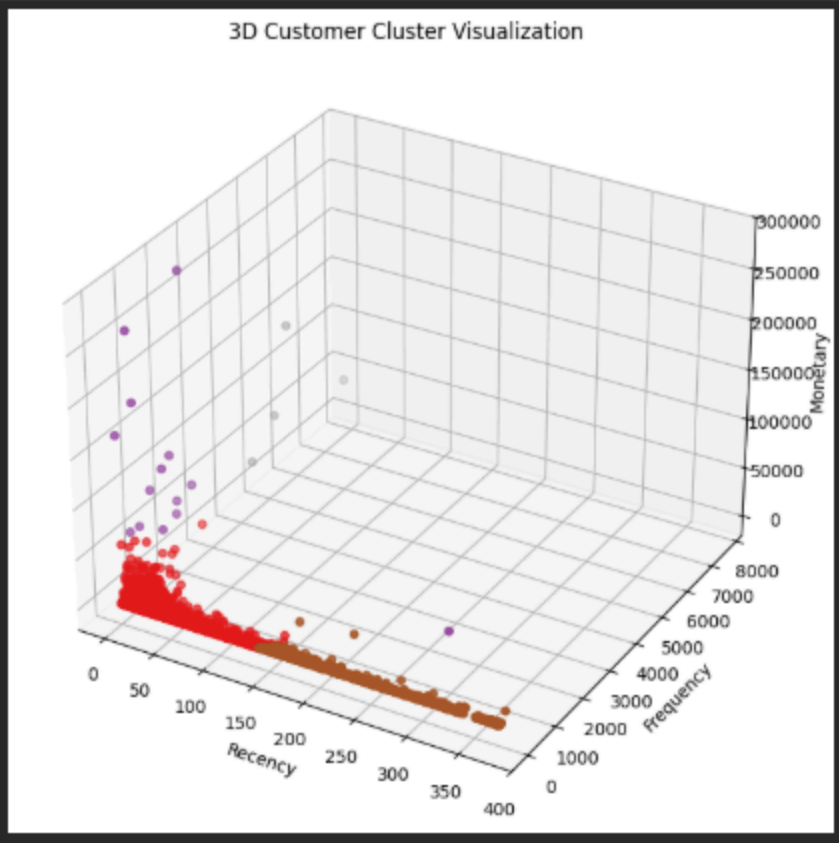

Figure 4.4.18 Customer Segmentation(3D Cluster plot-K Means)

This plot shows customer groups based on RFM analysis. Customers are divided into segments like high-value and at-risk. This helps in targeted marketing strategies.

```
#Average Monetary Value by Customer Segment

import seaborn as sns
import matplotlib.pyplot as plt

# Calculate average monetary value by customer segment using the rfm DataFrame's 'Cluster' column
avg_monetary = rfm.groupby('Cluster')['Monetary'].mean().reset_index()

plt.figure(figsize=(8,5))
sns.barplot(x='Cluster', y='Monetary', data=avg_monetary, palette='viridis', hue='Cluster', legend=False)
plt.title('Average Monetary Value by Customer Segment')
plt.ylabel('Average Spending')
plt.xlabel('Customer Segment (Cluster)')
plt.show()
```

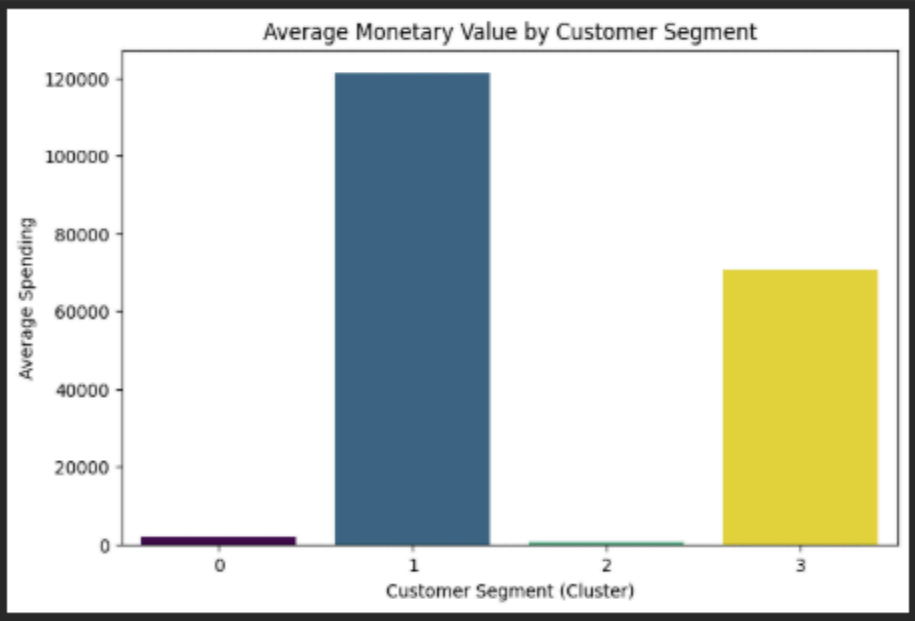

Figure 4.4.19 Average Monetary value by cluster

This chart compares spending across customer segments. High-value customers contribute the most revenue. This helps identify priority customer groups.

5. LEARNING OUTCOME

The successful completion of this internship has resulted in the following technical proficiencies and key competencies developed:

• Understanding of fundamental data science concepts, especially Exploratory Data Analysis (EDA), and their application in analyzing real-world datasets across different domains.

• Ability to interpret structured datasets and extract meaningful insights using statistical analysis and visualization techniques.

• Capable of applying data preprocessing techniques such as data cleaning, handling missing values, removing inconsistencies, and transforming variables to improve data quality.

• Proficiency in using Python libraries such as Pandas, NumPy, Matplotlib, and Seaborn for efficient data manipulation and visualization.

• Basic knowledge of machine learning techniques, particularly K-Means clustering, and its application in customer segmentation using RFM (Recency, Frequency, Monetary) analysis.

• Ability to analyze customer behavior patterns and translate them into actionable business insights such as customer retention and targeted marketing strategies.

• Strengthened analytical thinking, logical reasoning, and problem-solving skills through hands-on data analysis and real-world project implementation.

• Confidence in handling end-to-end data analysis workflows, from data collection and preprocessing to visualization and insight generation in real-world scenarios.

6. EXPERIENCE GAINED IN THE INTERNSHIP

This internship provided practical exposure to applying data science techniques on real-world datasets across different domains. Hands-on experience was gained in data preprocessing, including handling missing values, removing inconsistencies, and transforming data for analysis. Significant experience was developed in performing Exploratory Data Analysis (EDA) using visualization techniques to identify patterns, trends, and relationships within the data.

The internship also provided exposure to basic machine learning concepts, particularly in customer segmentation using RFM (Recency, Frequency, Monetary) analysis and K-Means clustering. Experience was gained in interpreting clustering results and deriving meaningful business insights such as identifying high-value and at-risk customers.

Additionally, the internship enhanced skills in using Python libraries such as Pandas, NumPy, Matplotlib, Seaborn, and Scikit-learn for data analysis and visualization. It also improved analytical thinking, problem-solving abilities, and the capability to translate data-driven insights into practical business decisions. Overall, the internship helped in understanding the complete workflow of data analysis projects from data collection to insight generation.

7. CONCLUSION

The data analysis and customer segmentation projects successfully demonstrate the practical application of data science techniques across multiple domains. By utilizing Exploratory Data Analysis (EDA), the projects effectively analyzed datasets related to streaming platforms, workplace mental health, and e-commerce transactions to uncover meaningful patterns and trends. The implementation of data preprocessing techniques ensured data quality and reliability, which played a crucial role in generating accurate insights.

The e-commerce project further highlights the application of basic machine learning techniques through RFM (Recency, Frequency, Monetary) analysis and K-Means clustering to segment customers based on their behavior. This segmentation enabled the identification of high-value, regular, occasional, and at-risk customers, providing valuable insights for targeted marketing and customer retention strategies. The use of visualization tools enhanced the understanding of complex data and supported effective data-driven decision-making.

Overall, the internship provided valuable hands-on experience in working with real-world datasets, performing data analysis, and applying basic machine learning techniques. It strengthened technical skills in Python, data handling, and visualization while improving analytical thinking and problem-solving abilities. The projects demonstrate how data-driven approaches can support business strategies, optimize decision-making, and generate actionable insights in real-world scenarios.

8. REFERENCES

• Datasets were given by the company, which provides real-world data for analysis and machine learning projects.

• Documentation and learning resources from Pandas and NumPy were used for data manipulation and numerical computations.

• Visualization techniques were implemented using Matplotlib and Seaborn, with reference to their official documentation.

• Machine learning concepts and clustering techniques were referred from Scikit-learn documentation.

• Online tutorials, blogs, and documentation were used to understand data preprocessing, Exploratory Data Analysis (EDA), and customer segmentation techniques.

• Guidance and learning materials provided during the internship at LabMentix also contributed to the successful completion of the projects.
